Problem statement: Build a dashboard for content creators to track the performance of their videos, view details about their uploads, and manage any copyright issues.

Must Have Features

- a. **Video Stats Dashboard:** A list showing all the metrics for a video, including views, text description, and how it's performing.
- b. **Watch History Undo:** A tool that tracks where a user stops watching a video, allowing them to jump back or undo accidental fast-forwards.
- c. **Next Video Queue:** A system that lines up videos for the "Up Next" recommendation list in a set order.
- d. **Copyright Checker:** A fast search tool that instantly verifies a video's unique digital ID (hash) against a central database of media licenses.
- e. **Retention Sorter:** A tool that ranks videos based on how long viewers actually watch them (viewer retention).
- f. **Channel Link Hub:** A central system that broadcasts links to the creator's channel globally to different content distribution platforms.
- g. **Video Processing Safety:** A feature that hides formatting errors during video conversion by displaying a safe, default slide instead.
- h. **Quality Optimizer:** A smart system that cuts the video into optimized segments to ensure the best quality and least amount of buffering for viewers.
